

Medical Checks for Children

# Medical Rapport Kenya West 2018

## MCC Kenya West 2018

### Introduction

Van 11 maart tot en met 17 maart 2018 heeft een MCC team wederom op diverse locaties in Kenia West naast uitgebreide gezondheidsvoorlichting aan care takers ongeveer 850 kinderen medisch onderzocht en behandeld.

De medical checks vonden in de omgeving van Kisumu en Eldoret plaats op ongeveer 1500 m hoogte. In de buurt van Kisumu werden op twee locaties kinderen gezien. In Kesengei kinderen van de Kesengei Nursery & Primary en in Kimarek kinderen van de Kimarek Nursery gezien. In de buurt van Eldoret werden in Chipsita kinderen van de St Peter's Kapkechui gezien. Daarnaast hebben wij dit jaar voor de vierde keer de children's reprimand home en de vrouwengevangenis in Nakuru bezocht. Een indrukwekkende en tevens confronterende ervaring.

Het overgrote deel van de gecheckte kinderen was jonger dan 10 jaar.

Het MCC team was in Kenia op uitnodiging Sophia Foundation for Children (<http://sophia-foundation.com/index.html>) welke op vele plekken in Kenia voedselprogramma's heeft op scholen en ook een weeshuis in beheer heeft.

Technische hulpmiddelen werden vanuit Nederland meegenomen door alle teamleden. Medicijnen zijn met behulp van de Sophia Foundation for Children besteld bij de Keniaanse groothandel Mission for Essential Drugs and Supplies (MEDS).

Het MCC-team bestond uit de volgende teamleden: Nadine van Dijk, Spoedeisendehulp arts, medisch eindverantwoordelijk en missieleider, bestuurslid MCC; Maria Duenk, leerkracht; Maria Heikoop, huisarts; Nel Mocking, mediator; Jolijn van de Zande, arts; Nori Smeets, arts; Larissa Kloowijk, arts en Jacqueline Fliervoet

Gedurende de controles op de scholen is gewerkt volgens het MCC-carrousel model met voor alle kinderen een tandenpoets instructie en een tandenborstel. Daarnaast is er aandacht besteed aan de voorlichting van ouders en begeleiders ten aanzien van voeding en hygiëne.

Wij waren erg blij om te zien dat het tandenpoets project dat vorig jaar gestart is nog steeds goed loopt! We hebben voor 2018 dan ook weer tandenborstels gedoneerd en proberen het aantal klassen waar gepoetst wordt langzaam uit te breiden. Voor de toekomst worden sponsors voor dit project gezocht!!

Door de financiële ondersteuning van de Sophia Foundation for Children konden we kinderen indien noodzakelijk doorsturen naar de locale kliniek welke ook ter plaatste geregistreerd werden voor een goede follow-up. Samen met de medewerkers van de Sophia Foundation zullen wij de follow-up van deze kinderen in 2018/2019 monitoren.

Onze speciale dank gaat uit naar Nopi, Tazos en Marina van de Sophia Foundation for Children. Mede dankzij hun aanwezigheid en participatie in ons team, is het gelukt om in deze afgelegen regio onder vaak moeilijke omstandigheden een geweldige prestatie neer te zetten.

De MCC-missie naar de regio rond Kisumu en Eldoret in Kenia, is een bijzondere ervaring geweest; de indrukwekkende landschappen, de scholen en de kinderen hebben een onvergetelijke indruk achter gelaten.

Door deze ervaringen en de resultaten die we samen weer hebben kunnen boeken, zien wij nu al uit naar het vervolg van deze samenwerking in 2019!

Nadine, Arnhem juni 2018

From March the 11th until March the 17<sup>th</sup> 2018, a Medical Checks for Children (MCC) team visited locations near Kisumu and Eldoret in western Kenya. Free of cost, the MCC team checked and treated 842 children aged newborn until 13 years of age.

---

After an explorative mission in 2010, MCC visited Kenya West for the eighth time.

Again, the medical checks were organized in close cooperation with the Sophia Foundation for Children (SFFC) ([www.sophia-foundation.com](http://www.sophia-foundation.com)).

Technical equipment and some of the supplies were brought from Europe by the MCC team members. Most of the medication was ordered through SFFC in Kenya. Additional local medication was purchased from the main pharmacy in Nairobi and taken with us to Kenya West.

Our special thanks go to Nopi and Tazos for their direct support during our medical camp and their help in all the necessary preparations during the year. Special thanks go to the translators and teachers.

#### **Medical Checks for Children on location:**

During the medical checks, the children were checked following the MCC carousel:

1. Registration of the child
2. Measuring height and weight
3. Blood test for haemoglobin
4. Physical examination
5. Giving medication and education about the correct use of it (pharmacy)
6. Education on hygiene and tooth brushing (a tooth brush was given to each child)

Anthropometric measurements were recorded, and a finger prick sample was taken for determination of the haemoglobin (Hb) concentration. Each child was examined by a Medical Doctor. History of illnesses in the preceding four weeks was recorded. Specifically, caretakers were asked if the child had diarrhoea, an upper respiratory infection, vomiting, eating soil (pica), decreased appetite and weight loss.

They were also asked if their child received treatment for any of these, and if so, from where. The data of the children were analysed through the MCC data base.

---

## MCC Kenya West 2018

The medical checks were performed on six days at different locations in Kenya West near the cities of Kisumu at Lake Victoria and near Eldoret. The team visited Kesengei Nursery & Primary at Kesengei; Kalamai Bay Nursery, Kimarek Nursery at Kimarek; St Peter's Kapkechui at Chipita, Nakuru childrens and reprimand home and Nakuru Women's prison.

At the different locations we checked beside the schoolchildren some young non-schoolgoing children from the villages.

We analysed the data to make a comparison as a group but we did not make a computer analysis on individual basis (table 1)

For the schools at Kimarek, Kesengei and St. Peters we did a separate analysis for the baby classes. In Kenya children as old as 5 years can still be in baby class. However, for this analysis all children of age 0-5 years seen at these locations were added to the baby class (e.g. Kesengei baby), in addition all other non-school-going children of the community were added to this group. The rest of the school children were pooled together (all above 1, e.g. Kesengei).

During the years the ratio between girls and boys is stable.

Table 1: Total children per location

This year we tried to locate the old files of all the children which should have been seen last year according to the school or according to the caretakers. About half of the children we saw were seen in previous years. This seems to be in concordance with other locations.

1: Growth abnormality and malnutrition:

Overall data of growth abnormalities in the last 3 years.

All locations	2015	2016	2017	2018			
underweight	17%	10%	9%	9%			
stunting	20%	11%	8%	6%			
wasting	6%	5%	5%	13%			

Malnutrition has been related to poor cognitive and school performance. There is strong evidence to suggest that malnutrition places children under the age of 5 at increased risk for mortality. Malnutrition is thought to account for one third of all deaths of children under five years of age (UN Millennium Developmental Goals).

Percentages of growth retardation is correlated with poverty, malnutrition, living conditions, hygiene and the prevalence of chronic diseases.

## **MCC Kenya West 2018**

The major causes of malnutrition are poor feeding practices and or lack of food inadequate childcare. Adequate food intake and education programs addressing nutritious food need to be provided.

Therefore, we assessed growth abnormalities, measuring and weighing all children in a standardized fashion, using the following criteria:

- Underweight = weight for age at or under the third percentile of the reference population (WHO growth curves), only children up to 10 years old. This is an indicator of malnutrition or weight loss because of disease.
- Stunting = height for age at or under the third percentile of the reference population, (WHO growth curves) only children up to 19 years of age. This is an indicator of chronic malnutrition.
- Wasting = weight for height at or under the third percentile of the reference population (WHO growth curves), only children up to 120 cm in height. This is an indicator of acute malnutrition.

The reported incidence for underweight (Kenya Statistical Factsheet WHO) is 16,5 % and for stunting 36%. These data are still the most recent WHO/Unicef country data from 2013.

Analysis of the nutritional status shows significant differences among the locations visited ( see table 4, 5 and six) Within the children assessed, it is unknown how many children have HIV related weight loss (wasting syndrome).

In 2015 the incidence of underweight, stunting and wasting in Kimarek Nursery was 13%, 35% and 1% compared to 15%, 9%, 10% this year. In 2015 the numbers for St Peters overall were 6%, 8% and 2% compared to 4%, 5% and 2%.

Over the years there seems to be a positive trend towards less growth disorders. As always these conclusions must be made with the greatest of care as the population we see differs each year and only half of all children were seen in the previous year.

Of the 16 babies seen in the Nakuru woman's prison 5 had severe malnutrition ( 25% stunting). The reality of growing up in these conditions is harsh and we do realize that interventions are problematic due to strict regulations and control. We hope that the SFFC will be able to reach out into the secluded community and provide these vulnerable babies with a bit of extra nutrition to help them grow.

The overall prevalence for underweight, stunting and wasting showed minimal decrease in 2017. It is difficult to find a cause for this as the parameters are multifactorial and the groups of children we see show a lot of heterogeneity during the years.

In comparison with previous years the reported incidence of malnutrition and growth retardation is stable and the incidence of stunting is again well below the reported WHO incidence in Kenya. Selection bias due to the large population of school going kids may be a factor in underreporting severe malnutrition.

During the medical check-ups of this year, we paid again attention to issues of hygiene and nutritional advice. For babies, we advised exclusive breastfeeding up to six months and then start with the introduction of additional foods.

On the schools that are in the feeding program of the SFFC, each month dry foods are given. Fruit and vegetables are locally purchased and depend on the availability and the season. Also we know that if the schools accept more children as was the case in St.Peters the amount of food is divided between more

## MCC Kenya West 2018

children. Most of the children get their first meal of the day at school, 11 am porridge and somewhere around noon lunch. The amount of food the children receive at home for dinner could vary widely.

We are aware of the financial problems and, because of draught, scarcity of healthy food for many families.

### 2: Anaemia:

Overall data of anaemia in the last 3 years.

Overall	2015	2016	2017	2018			
Anaemia yes	37%	39%	45%	27%			
Hb < 5		2%	1%	1%			

Anemia is the most prevalent micronutrient disorder in the world. In Kenya, no national policy has been implemented so far to provide iron supplements to pregnant woman or young children.

While iron deficiency is frequently the primary factor contributing to anaemia, it is important to recognise that the control of anaemia requires a multi-faceted approach.

In addition to iron deficiency, infectious diseases such as worm infections, other chronic infections, particularly HIV-AIDS and tuberculosis, as well as other nutritional deficiencies, and as side effects of ART medication in HIV positive children.

It is unknown how many children with abdominal problems have iron deficiency anaemia and a coexisting H. pylori infection. From literature it is known that one should suspect an infection with H. pylori when the iron deficiency anaemia is refractory to iron administration.

This year the prevalence was lower than in previous years.

---

We treated the children with anaemia (and their mothers if they were breast fed) with supplements for three months. If we suspected a vitamin deficient and/or a infection we gave multivitamins instead of iron supplements.

### 3: Worm treatment:

Overall data of profylactic antiwormtreatment for all locations in the last 3 years.

## MCC Kenya West 2018

>=5 en <=10 years	1	1%	0	0%	0	0%	0	0%	1	1%	0	0%
>10 years	0	0%	0	0%	0	0%	0	0%	0	0%	0	0%

Health education on the spot was aimed at increasing awareness of worm transmission, the divers problems caused by intestinal helminth and the importance of bi-annual de-worming every six months. At all the visited schools we tried to explain to the teachers and people in charge why this deworming is so important for the children.

#### 4: Pneumonia: (3/842, <1%) (see table appendix)

"Pneumonia", "coughing", "fast/difficult breathing", "chest indrawing" and "inability to suck milk" are the key words used by care-takers indicating a (severe) ARI (fever with tachypnoe).

The 7 children with a severe acute respiratory infection (ARI) were treated with appropriate antimicrobials and home treatment advice. We saw 4 children with asthma/bronchitis. If needed these children were treated with ventolin on the spot and were given instructions about the use of inhalers. In case of babies the mothers were instructed how to use the babyhaler. The SFFC will provide follow up visits.

#### 5: Cardial problems: (4/842, 1 %) (see table appendix)

Mitral regurgitation or ventricular atrial septal defects being the most common heart problems in the third world. For this condition no treatment is available although a good dental situation is essential for a healthy live.

The MCC carousel includes a cardial examination. We suspected 1 girl of having a new pathological heart murmur. All the new and old cardiac kids together with their caretakers received extra information about their conditions. The children and their care takers were stressed on teeth brushing procedures. Besides this, they were told to give their child antibiotics when going to a dentist for a teeth extraction. These children were transferred to the Coptic Hospital in Nairobi with a clinical suspicion of severe congenital defect. If necessary we will provide costs for treatment with the Nleuwendijk Foundation. We did a follow up for all the cardiac children from previous years and provided medication and treatment as needed.

#### 6: Skin diseases: (84/842, 8%)(see table 1 of the appendix)

This year we saw 24 (64/842, 8%) children with dermatomycoses including tinea capitis; the first time in the last 3 years we see a decline. This could be due to the fact that we only treat tinea capitis with systemic

## MCC Kenya West 2018

treatment in case of severe disease (> 50% of head affected, or severe superinfections or growth disorders). We saw 10 children with scabies (2%) and treated 7 children with ivermectin for scabies .

We accept a certain degree of underscoring. As tinea capitis is widespread in the schools due to transmission of the fungus by razorblade and other factors, we only reported and treated the serious cases.

Antifungal cream (eventually in combination with hydrocortison) was given for fungal infections (dermatomycosis) and hydrocortison crème was given for different forms of skin disorders. We did treat the children with severe or infected forms of tinea capitis with griseofulvin.

The reported incidence of skin related problems is stable. We interpreted this as a good sign as we do see a lot on newcomers in our medical camp each year. The awareness at the schools, especially the SFFC schools, for hygiene, sanitation and healthy food could also have an impact here.

7: Dental: (caries not otherwise specified: 130 /842, 15%; painful caries: 29/842, 3%)

In general a high caries prevalence was found. Our reported incidence of 3 % for painful caries is low. This is due to underscoring. We still see a need for a dental camp and will try to bring our dentist with us next year.

At the last station of the medical carousel local volunteers gave out toothbrushes and educated the children and their caretakers in teethbrushing.

After starting the brush at school program in 2015 in Kimarek and St.Peters, we were happy to see that the schools were still brushing the teeth in the classes. The aim of this project is that all children have their own toothbrush at school. And the whole school brushes their teeth at school together with the teachers. Washing hands and hygiene is also part of the program.

We as MCC provided education, instruction folders, brush posters and tooth brushes for the schools. The folders and posters were based on the program developed by NIOSH. The SFFC provided the tooth brush holders for each classroom. In these schools we organized a meeting with all the teachers and selected students who were then in charge of training their classes. The SFFC still does follow-up visits in the classrooms during their monthly visits.

8: Other

### Further recommendations

#### Deworming

This year most children of the SSFC schools did receive the antiworm tablet. These tablets were from the MCC/SSFC stock. Unfortunately, the outreach from the governmental program still appears to differ greatly between locations. If we look at the data from the last 3 years we do see a negative trend.

We need to establish a structure where at least in the SSFC schools the coverage of this prophylactic antiworm programme is 100%!

We still recommend to contact the local health clinics or hospitals responsible for the governmental deworming programme locally and make sure all children of the SSFC schools are reached by this programme.

E.g., is it possible for the teachers to get the albendazole directly from the health clinics for distribution? Or should the SSFC coordinate the twice annual distribution of the antiworm pills?

#### Nutrition

The incidence of growth disorders seems to be stable when we compare the results to the results of the last 3 years. The schools where the SSFC has a feeding programme shows an even lower incidence rate of severe growth abnormalities. The anemia rates are stable also in the schools where the SSFC has a feeding programme. Like discussed during the medical camp the young newcomers in the nursery and baby classes seem to have a poor nutritional state when entering the school. During the years they will benefit the most from the feeding programme.

We would encourage SSFC to proceed with the food programmes at the schools and nurseries.

There is a need for further education about nutrition and healthy living for teachers and health workers.

#### Cardiac problems

Every year we see children with suspected pathological heart problems. In Kenya there is not any governmental programme for these needy children and the cost of medication and operations fall to their parents.

Heart operations are expensive (KS 100.000) and need extensive follow-up and chronic medication.

In the area of Njeri there is an ngo for heart children Ndugu Zangu who works together with a dutch ngo Heart for a Child's heart. We are trying to find a way to work together.

#### Skin disorders

Fungal infections of the head are still common. Although the reported incidence is dropping through the years. A probable cause could be the governmental decree for school children to shave their head.

Unfortunately the fungus does spread through dirty razors. Is there a role the SSFC can play in this matter? Is it possible to provide clean razor blades?

In general we see a lot of children with dirty skin due to poor hygienic conditions. This poses a risk for getting skin infections. We do know that water is a problem but should stress that children should clean dirty wounds with water to prevent more serious infections.

Is there a role a town nurse or dedicated teacher can play in hygiene and wound matters?

Are there local beliefs about skin and wounds we are not aware of?

#### Teeth

During the years we've seen a lot of children with dental problems. The last dental camp in Western Kenya has been some years ago. We need to make a sustainable plan for the dental care in the areas where the SSFC works. At the moment we are only able to refer children with painful caries at an ad hoc basis. This

---

## **MCC Kenya West 2018**

means only children with pain are being transported to a dental clinic where we pay the full costs. Is there a way to have a more proactive dental plan in the areas where the SFFC works?

This year we were able to raise enough toothbrushes for the brush program in 2017.

There is also a need for further education of teachers and healthcare workers on the importance of this subject and the role it has in the general health of the children.

### Health and Hygiene

In general we notice that knowledge about what is good health and hygiene among children, caretakers and sometimes even teachers is little.

To change the first step is education. Does the SFFC think there is a need for education about food safety, clean water, cleanliness, fit for school and fit for life subjects?

### Last words:

Thanks to the amazing support from Marina, Matt, Tazos and Noppi from the Sophia Foundation we were able to give a lot of children their share of medical care and personal attention. We all felt to be part of one big team and all team members expressed the wish to come back again next year.
